
At the even meetings the lowest |L| changes with the step size (4×10⁸, 5×10⁷, 5×10⁶ ħ; at 10,000 steps the numerical L even crosses zero): this is the numerical limit, not a physical value.
Annihilation would need |L| of order 1 ħ (b ~ 1/m = 1.1×10⁻¹⁷ cm), which this classical simulation cannot resolve.
